

ABSTRACT

A hair clip assembly for protecting pretreated hair from
5 damaging effects of a treatment chemical applied to new hair
growth. The hair clip assembly comprises two spring-biased
jaw members, each having a substantially flat, rectangular
hair shield extending therefrom. After selective attachment
of the hair clip assembly to a section of hair, in proximity
10 to the junction between the pretreated hair and the new hair
growth, the hair shields protect the pretreated hair from
needless exposure to the treatment chemical.
